

Shopfloor APP

Initial Configuration

1. Install the xx_shopfloor_frontend module.
2. You will see a new app on the dashboard. Open it.
3. The application is web responsive, so you can test it on a tablet, PC, or mobile phone.
4. To properly test the Shopfloor App, you will need a barcode scanner. If you do not have one, you can simulate a scan by opening your browser's developer tools (In most browsers, you can open them by pressing F12). Then, in the console, write:

```
testBarcode("WHATEVER YOU WANT TO SCAN");
testBarcode("Maria");
testBarcode("S0000000000042");
```

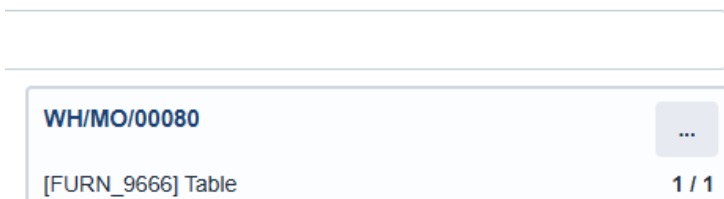

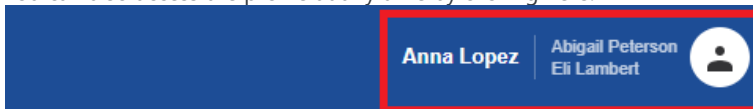

Work Centers

When you open the app, the first thing you will see is the list of available work centers. Choose one.

Profile

1. You can change the language or the work center from here.
2. Enter the Badge ID configured when creating the user, or scan the barcode that represents the Badge ID with a barcode scanner.
3. You can scan a Badge ID barcode from anywhere in the application. If there is already a machine operator assigned, the scanned employee will be set as a machine helper. If there is no operator assigned, the scanned employee will be set as the machine operator.
4. You can also access the profile at any time by clicking here:

Work Orders List

You will see all available work orders with a white background. If one has already been started and is currently in progress, it will appear with a green background.

1. If you click the three dots shown in the image, you can move that work order to another work center. The other work center must be configured as an Alternative Work Center in Manufacturing > Configuration > Work Centers > Work Center.

WH/MO/00076

[FURN_9666] Table
Assembly

2. When you click on a work order, you will open it.

Work Order

When you open a work order, you will see this view:

The screenshot shows the Odoo Work Order interface. At the top, there is a header bar with the Odoo logo, 'WORKCENTER Assembly 1', a 'Workorder List' button (1), and user information for Anna Lopez and Abigail Peterson. Below the header, the work order ID 'WH/MO/00076' (2) is displayed. The main area is divided into several sections: 'This shift: 0s' and 'Total: 20m 57s' (4), a green 'Start' button, 'Product ID: 54', 'Estimated duration: 60 min', and 'Product: [FURN_9666] Table' (3). Below these are three columns: 'Production Tags' (5) showing 'CREATED 0/1', 'Materials' (6) listing '[CONS_89957] Bolt' and '[CONS_25630] Screw', and 'Quality Controls' (7) showing 'CONTROLS 2' and '1 pending controls'. At the bottom are 'Instructions' (8) showing 'INSTRUCTIONS 2' and '2 pending instructions', and 'Attachments' (9) showing 'FILES 2' and 'worksheet_document'.

1. This button is used to see all work orders available for this machine.
2. This is the name of the Manufacturing Order.
3. This shows information about the Manufacturing Order and the Work Order.
4. This section is used to control the working time.
 - a. This Shift shows the time you have worked during the current shift on this work order.
 - b. Total shows the total time everyone has worked on this work order.
 - c. Start/Stop Button:
 - i. Start:
 1. When you press the Start button, the productivity time of the machine operator and helpers will start counting.
 2. You will see the Stop button.
 3. Both timers will start counting.
 4. You will be able to access all the sections below, such as Materials and Quality Controls. If the work order has not been started, you cannot open them.
 - ii. Stop:
 1. You will have 3 reasons to stop production. If you only press Stop and do not select anything else, after 7 seconds the stop reason will be set to Break automatically.
 - a. Break: This is the default stop reason. It is used for lunch breaks, rest breaks, or any temporary pause.
 - b. End Shift: This is used when the user goes home and ends their shift. The operator will be automatically logged out from the tablet.
 - c. End Work Order: This is used when you have finished the production, consumed all the materials, and want to close the work order. After that, the work order will no longer appear in the tablet's work order list.
5. **Production tags** are used to register production as a box or as a pallet, depending on what was configured in the Odoo work center under Package Kind for Production.
 - a. Here, you can create the box, change its quantity, and then decide whether to confirm or cancel it.
 - b. If the work order has Required Tooling, the app will not let you produce until you register the tooling. To do this, click the REGISTER TOOLING button and scan the barcode of the tooling serial number.
 - c. The app may also indicate that there are pending quality checks. You must complete them before producing.
 - d. If some products are produced with defects, you can scrap them.

HISTORY

No history

6. **Materials:** Whenever you are in a work order, no matter where you are in the application, if you scan the barcode of a package that contains a material to be consumed in that work order, you will be redirected to the Materials view.
- The app will automatically calculate the quantity to consume by default and select the scanned package.
 - When you scan a package number, you can choose whether to consume it or mark it as damaged and scrap it.
 - If you consume a material, you will see the movement in the history below.
